

# BDCOM GPON OLT SFP Transceiver Class C+++

## OLT-GSFP-C+++ (8dBm)

### Product Features

- SC BIDI SFP Single Mode Transceiver
  - 1490nm Continuous Mode 2.488 Gbps DFB Transmitter
  - 1310nm Burst Mode 1.244 Gbps APD-TIA Receiver
- Single +3.3 Power Supply, Hot-pluggable
- LVTTTL receiver Fast Burst Packet Detect indication
- Burst mode received signal strength indication (RSSI) function
- Complies with Telcordia (Bellcore) GR-468-CORE
- Class I laser safety standard IEC-60825 compliant
- Compliant with SFP MSA and SFF-8472
- Complies with ITU-T G.984.2 Class C+++

### Product Applications

- GPON OLT For P2MP Application

### General

The BDCOM OLT-GSFP-C+++ transceiver supports typical 2.488Gbps data rate for GPON OLT application up to 20km transmission distance, it's designed meeting with ITU-T G.984.2 Class C+++ specifications. SC receptacle is for optical interface.

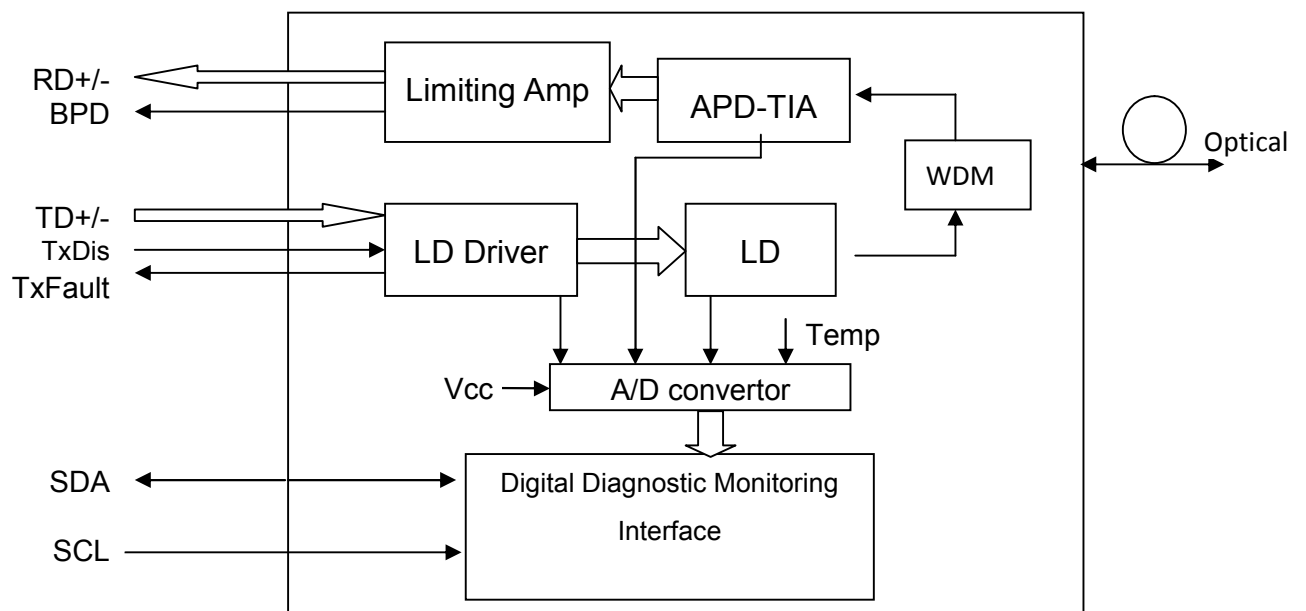

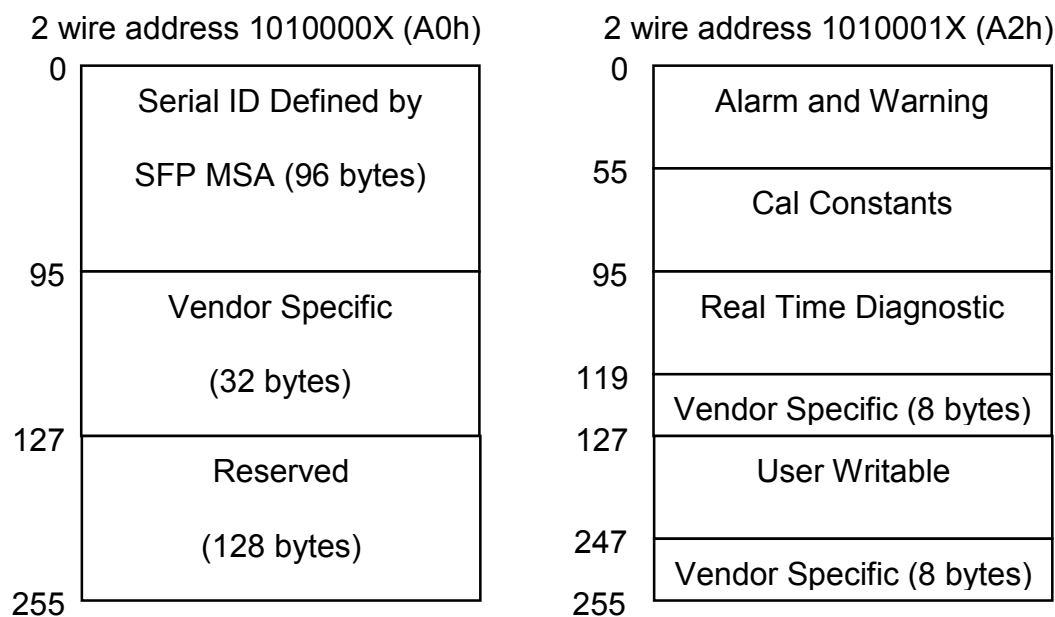

Fig 1 Transceiver Block Diagram

The module provides digital diagnostic information of its operating conditions and status, including transmitting power, laser bias, receiver input optical power, module temperature, and supply voltage. Calibration and alarm/warning threshold data are written and stored in internal memory (EEPROM). The memory map is compatible with SFF-8472, as shown in Fig. 2. The diagnostic data are raw A/D values and must be converted to real world units using calibration constants stored in EEPROM locations 56 – 95 in A2h.

#### Alarm and Warning Thresholds (Serial ID A2H)

Parameter(Unit)	C Temp (°C)	Voltage (V)	Bias (mA)	TX Power (dBm)	RX Power (dBm)
High Alarm	100	3.6	80	+8	-10
Low Alarm	-10	3	1	+5	-30
High Warning	95	3.5	70	+7.8	-11
Low Warning	0	3.1	2	+6	-29

#### Digital Diagnostic Monitor Accuracy

Parameter	Unit	Accuracy	Range	Calibration
Tx Optical Power	dB	$\pm 3$	Po: -Pomin~Pomax dBm, Recommended operation conditions	External/Internal
Rx Optical Power	dB	$\pm 3$	Pi: Ps~Pr dBm, Recommended operation conditions	External/Internal
Bias Current	%	$\pm 10$	Id: 1-100mA, Recommended operating conditions	External/Internal
Power Supply Voltage	%	$\pm 3$	Recommended operating conditions	External/Internal
Internal Temperature	°C	$\pm 3$	Recommended operating conditions	External/Internal

## PIN Diagram

## PIN Description

Pin No.	Name	Function	Plug Seq.	Notes
1	VeeT	Transmitter Ground	1	
2	Tx Fault	Transmitter Fault Indication	3	Note 1
3	Tx Disable	Transmitter Disable	3	Note 2
4	MOD-DEF2	Module Definition 2	3	Note 3
5	MOD-DEF1	Module Definition 1	3	Note 3
6	MOD-DEF0	Module Definition 0	3	Note 3
7	Reset	Reset signal input	3	
8	BPD	Burst Power Detect (active HIGH)	3	Note 4
9	RSSI-Trigger	Receiver Signal Strength Indication	1	
10	VeeR	Receiver Ground	1	Note 5
11	VeeR	Receiver Ground	1	Note 5
12	RD-	Inv. Receiver Data Out	3	Note 6
13	RD+	Receiver Data Out	3	Note 6
14	VeeR	Receiver Ground	1	Note 5
15	VccR	Receiver Power Supply	2	Note 7, 3.3V± 5%

16	VccT	Transmitter Power Supply	2	Note 7, 3.3V $\pm$ 5%
17	VeeT	Transmitter Ground	1	Note 5
18	TD+	Transmitter Data In	3	Note 8
19	TD-	Inv.Transmitter Data In	3	Note 8
20	VeeT	Transmitter Ground	1	Note 5

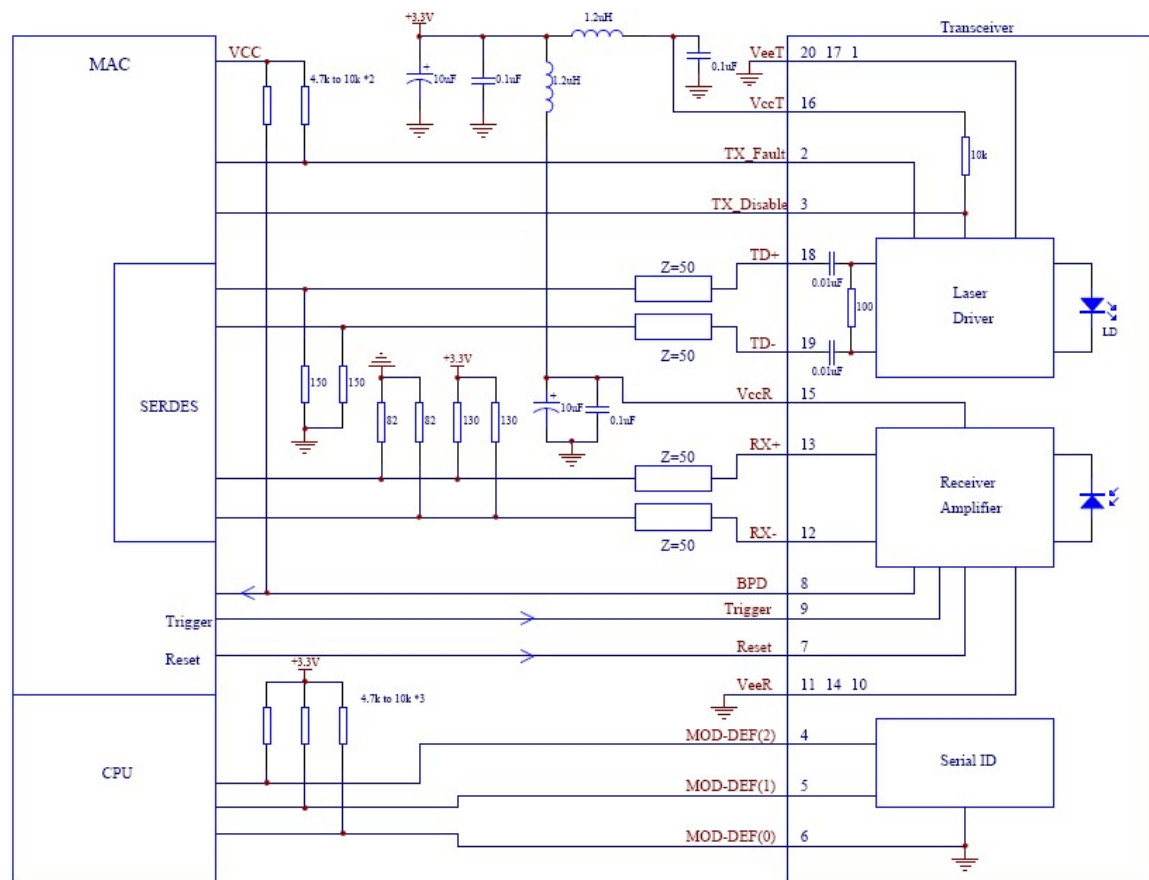

Notes:

1. TX Fault is an open collector/drain output, which should be pulled up with a 4.7K–10K $\Omega$  resistor on the host board. Pull up voltage between 2.0V and VccT, R+0.3V. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
2. TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7–10 K $\Omega$  resistor. Its states are:  
Low (0 – 0.8V): Transmitter on  
(>0.8, < 2.0V): Undefined  
High (2.0 – 3.465V): Transmitter Disabled  
Open: Transmitter Disabled
3. Mod-Def 0,1,2. These are the module definition pins. They should be pulled up with a 4.7K – 10K $\Omega$  resistor on the host board. The pull-up voltage shall be VccT or VccR.  
Mod-Def 0 is grounded by the module to indicate that the module is present  
Mod-Def 1 is the clock line of two wire serial interface for serial ID  
Mod-Def 2 is the data line of two wire serial interface for serial ID
4. BPD is pulled up internally with a 4.7K – 10K $\Omega$  resistor. Pull up voltage between 2.0V and VccT, R+0.3V. When LOW, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). HIGH indicates normal operation. In the low state, the output will be pulled to < 0.8V.
5. VeeR and VeeT may be internally connected within the SFP module.
6. RD-/+: These are the differential receiver outputs. They are DC coupled 100 $\Omega$  differential lines which should be terminated with 100 $\Omega$  (differential) at the user SERDES.
7. VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V  $\pm$ 5% at the SFP connector pin. Maximum supply current is 450mA. Recommended host board power supply filtering is shown below. Inductors with DC resistance of less than 1 $\Omega$  should be used in order to maintain the required voltage at the SFP input pin with 3.3V supply voltage. When the recommended supply filtering network is used, hot plugging of the SFP transceiver module will result in an inrush current of no more than 30 mA greater than the steady state value. VccR and VccT may be internally connected within the SFP transceiver module.
8. TD-/+: These are the differential transmitter inputs. They are AC-coupled, differential lines with 100 $\Omega$  differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board.
